NANNY-APP · PRODUCT & ENGINEERING

Product Requirements Document

Product scope, users, requirements, acceptance criteria and measurable outcomes

Version 1.0 10 October 2026 Status: implementation baseline + launch requirements

1. Product vision and scope

Nanny-App is a childcare marketplace that helps parents discover verified nannies, arrange care, coordinate the session and maintain a transparent manual payment ledger. It gives nannies tools to present their experience, publish availability, manage work and build reputation. Web administrators verify providers, moderate users, resolve disputes, support customers and reconcile payment records.

> **Product boundary.** The pilot records held, released and refunded payment states; it does not charge cards, transfer money or provide automated escrow. Android supports parent and nanny journeys. Administrative and maintenance work remains web-only.

Business goals

Trust

Safer discovery

Show only active, verified nannies in parent search and retain document-review controls.

Reliability

Consistent booking

Prevent overlaps and keep booking, ledger and notification changes atomic.

Growth

Pilot conversion

Move qualified visitors from registration to a completed first booking.

Operations

Visible queues

Give staff one action centre for verification, safety, disputes, support and delivery work.

2. Users and needs

User	Primary need	Key outcomes
Parent	Find trustworthy care that fits a time, place and child profile.	Verified search, saved nannies, children, booking, PIN, messages, review and support.
Nanny	Present qualifications and reliably manage jobs.	Profile, portfolio, availability, accept/reject, check-in/out, earnings and reviews.
Administrator	Operate trust and safety with a clear audit trail.	Verification, users, bookings, disputes, ledger, support, contacts, reports and notices.
Operator	Deploy, monitor and recover the platform.	Migrations, workers, backups, restore drills, logs, HTTPS and APK publishing.

3. Feature requirements

ID	Feature	Requirement	Status
FR-01	Account lifecycle	Register parent/nanny, verify email, authenticate, recover password, change password and revoke prior credentials.	Implemented; live email gate
FR-02	Nanny discovery	Search and filter eligible verified nannies, inspect profile/reviews and save favourites.	Implemented
FR-03	Children	Parents create, edit and delete child profiles; booking accepts only owned children.	Implemented

FR-04	Booking lifecycle	Create, reschedule, accept/reject, cancel, check in using one-time PIN, check out, confirm or dispute.	Implemented
FR-05	Ledger	Store agreed amount and manual receipt/release/refund state transactionally with booking decisions.	Implemented manual ledger
FR-06	Communication	Authorized direct messages, in-app notifications and support tickets.	Implemented
FR-07	Trust profile	Nanny profile, availability, portfolio documents, admin verification and ratings.	Implemented; live review procedure gate
FR-08	Administration	Action centre, dashboards, user controls, verification, bookings, disputes, ledger, support, contacts, notices and reports.	Web implemented
FR-09	Distribution	Responsive PWA plus signed Android APK download served from a private server path.	Endpoint ready; signed APK gate

4. User stories and acceptance criteria

Parent

- **As a parent, I can book eligible care.** Given a verified account, owned child, future time within published availability and no overlap, creation stores the booking and agreed amount; invalid ownership, time or conflict returns a safe error.
- **As a parent, I can verify arrival.** A six-digit PIN is visible only to the owning parent; the assigned nanny can use it once, with five failed attempts before regeneration is required.
- **As a parent, I can resolve completion.** After checkout, confirmation completes the booking and releases the held ledger entry atomically; a dispute preserves the ledger for admin review.

Nanny

- **As a nanny, I can manage availability.** Valid non-overlapping daily time ranges save; bookings must fit every requested minute.
- **As a nanny, I can manage assigned work.** Only the assigned nanny may accept, reject, check in or check out from allowed states.

Administrator

- **As an admin, I can triage risk.** The action centre exposes counts and links for safety tickets, disputes, verification, receipts, contacts and worker queues.
- **As an admin, I can reconcile manually.** Actions require CSRF protection and role checks and explicitly state that no bank transfer occurs.

5. Success metrics

Metric	Definition	Pilot target
Verified activation	Verified users who complete role profile within 7 days.	Baseline first; target ≥60%
First-booking conversion	Verified parents creating a valid booking within 14 days.	Baseline first; target ≥35%
Booking completion	Completed bookings ÷ confirmed bookings.	≥85%
Conflict integrity	Overlapping active bookings created.	0
Safety response	Median time to first admin action on safety ticket.	<4 business hours
Availability	Successful external HTTPS checks.	≥99% during pilot support hours
Restore readiness	Successful rehearsed DB + uploads restore.	100% before public launch

6. Scope and release gates

Included: web/PWA, native Android, shared API/database, local or S3-compatible private storage, account email, manual ledger and web administration.

Excluded from pilot: native iOS, automatic card charging, automatic payouts, bank escrow, public document storage and multi-region high availability.

Launch gates: production domain and HTTPS, secrets, migrations, worker scheduling, verified email delivery, signed APK, private upload backup, restore drill, real-device/accessibility checks, policy content and operational ownership.
